

## Food Grade Pigment Powders for Printing on Various Foods & Packaging Substrates

Increase Productivity. Ensure Quality. Reduce Downtime.

- **Increase Productivity** — Print barcodes and graphics directly onto the surfaces of fruits, vegetables, eggs, pills and more — omit the need and usage of food stickers and labels.
- **Ensure Quality Packaging** — Fast-drying, non-toxic pigments are compatible with various bio-organic surfaces and packaging, including paper, plastic, aluminum, glass, freezer bags, and more. Inks are durable and can withstand moisture, chemical abrasions, and elasticity.
- **Reduce Downtime** — Automated production and delivery of goods allows for streamlined operations and reduces downtime.

The F-Series food grade pigment powders are for users looking to develop, produce and market applications based on the properties and regulatory compliance requirements associated with food and food packaging.

Delivered in base components, the pigments are available in a large variety of colors and are ideal for inks (dot-on-demand, offset, and flexo), as well as paints, pastes, dispersions, gels, and powder compositions.
